SUMMARY

Full-stack engineer (serverless Node.js, PostgreSQL, AWS, React/TypeScript) with 5 years at an early-stage legal tech startup. Joined as the 3rd engineer and helped build GoVeyance, a real estate closing platform used by ~200 BC law firms, from scratch through to a majority investment in 2025 from Teranet, Ontario's land registry operator.

EXPERIENCE

ReadyWhen Tech Inc. — Legal Technology Startup (GoVeyance) **Remote**
Full Stack Engineer *Mar 2021 – Mar 2026*

- **Statement of Adjustments —** designed and built Ontario's real-time financial calculation engine from scratch: a shared, reusable backend handling each adjustment type, with a drag-and-drop UI aggregating funds in and out.
- **Private Lending** — built the Payout Investors module for an industry-first private mortgage lending workflow, saving firms an estimated 30–60 minutes per file: nested modals, drag-and-drop tables and live validation tracking investor debits and credits through to payouts and trust reconciliation.
- **Ontario expansion** — one of the top three contributors to the Ontario backend: reworked BC workflows for Ontario requirements and built net-new features end to end (schemas, serverless APIs, UI), working directly with product to turn provincial requirements into specs.
- **Accounting feature** — built BC's fee and disbursement accounting system with Canadian sales tax (GST/PST): a reusable Account Library with real-time tax recalculation, account-template tooling, and backend tests and fixtures.
- **Internal tooling** — sole owner of client-onboarding default data seeding: designed the schema and application logic for checklists, undertakings, accounts, and fee/charge templates, saving customer support staff at least an hour of manual entry per new company. The schema evolved through database migrations, with separate BC and Ontario templates. Integrated Canada Post address validation behind a backend abstraction layer.
- **Support Portal contacts API** — built the backend for global contact management used by support staff: REST endpoints for law firms, financial institutions and lender branches, with pagination, sorting and search across related office and person records.
- **Document generation** — built and maintained backend data mappings for the automated Word/PDF legal document service across 52 tickets over two years: JMESPath field mappings from platform data to legal documents, plus output-formatting logic.
- **Hiring & mentoring** — interviewed 15–20 frontend and backend candidates and wrote the team's phone-screen questions; mentored a junior engineering intern through code reviews and onboarding to their first production feature.
- **Contact management dashboard** — built the frontend for a dashboard managing 2,500+ contacts: search, sorting and filtering with server-side pagination, integrated with REST APIs for creating, editing and deleting contacts.

TECHNICAL SKILLS

Backend: Serverless Node.js, RESTful APIs, PostgreSQL, Sequelize, SQL, Express, JMESPath
Frontend: React, Redux Toolkit, RTK Query, TypeScript, HTML, CSS, Formik, MUI, react-dnd, JSON Schema
Cloud & Tools: AWS (Lambda, API Gateway, S3, Cognito, CloudWatch), Serverless Framework, CI/CD, Jest, Vitest, Cypress, Lerna
AI: Claude Code, Codex
Familiar: Python, Docker, MongoDB

EDUCATION

M.S., Computer Science & Engineering — Open University of Economics, Management and Law 2023 – 2025
Web Development — Juno College of Technology 2020 – 2021

CERTIFICATIONS

AI Agents Course, Model Context Protocol (MCP) Course — Hugging Face 2026
Practical Deep Learning for Coders 1 — fast.ai 2026
AWS Certified Cloud Practitioner — AWS 2026
Introduction to Databases with SQL — Harvard University 2023
